

## Spectis Experience & Equipment for Intricate Design

Some projects come to Spectis with complex details of design and scale. Here is a project that, as of today, is still being installed. All columns, capitals and mouldings were made right here at our manufacturing facility in Manitoba, Canada. We are pleased and fascinated watching this project come together!

Our 5-axis CNC machine and large 3D resin printer were a great benefit to our team of experts as they created many different angled and compound radius masters to fit the curvature of the ceiling. Along with the ornate capitals and columns, this project improved our tooling capabilities and expertise to manufacture beautiful large-scale projects.

### The Importance of Adhesive for Installation

The importance of using Spectis Adhesive or PL Premium to install polyurethane products cannot be over-emphasized. It is the adhesive that holds polyurethane in place. However it expands as it cures, therefore all products must be screwed down until they are fully cured.

In our catalogue, under the installation instructions, it states, "It is necessary to use copious amounts of Spectis adhesive on all bedding edges and joints for warranty to be valid." Make sure adhesive is oozing from the seams when assembled. Excess adhesive should be removed immediately. After 24 to 48 hours of curing time, a knife will be necessary to remove the remaining adhesive. At this time, the screws can be removed, if desired, and the holes filled with an automotive-type bondo for a seamless finish. Spectis adhesive is also fully paintable which aids in hiding any adhesive remaining on the outside of the seam once cured.
